### **Cartosat-3 Improved Products**

 3<sup>rd</sup> generation IRS mission launched on 27<sup>th</sup> Nov 2019 for Cartography Applications with PAN, MX Sensors

| Sensor | Processing Level | Output<br>Resolution | Swath<br>(km) |      |
|--------|------------------|----------------------|---------------|------|
|        |                  |                      |               |      |
|        | Orthorectified   |                      |               | - AL |
| MX     | Geo Orthokits    | 1.1 m                | 17            |      |
|        | Orthorectified   |                      |               | 12   |

- Current operational data products are generated and disseminated to users after meeting QC criteria
- In addition, new set of data products are introduced with enhancements in terms of – redefined spatial sampling, frame size(sub-swath) and uniform radiometric quality

These improvements are implemented based on the following QA factors:

- PAN resolvability at 45 cm spatial resolution
- Avoiding underlap in MX
- Avoiding severe optical butting of detector devices
- Normalized to Carto-2S swath
- Improved TAT and Processing time by 40%

24 devices (D1-D24)cover 17km swath

To increase utilization of data products for applications like-

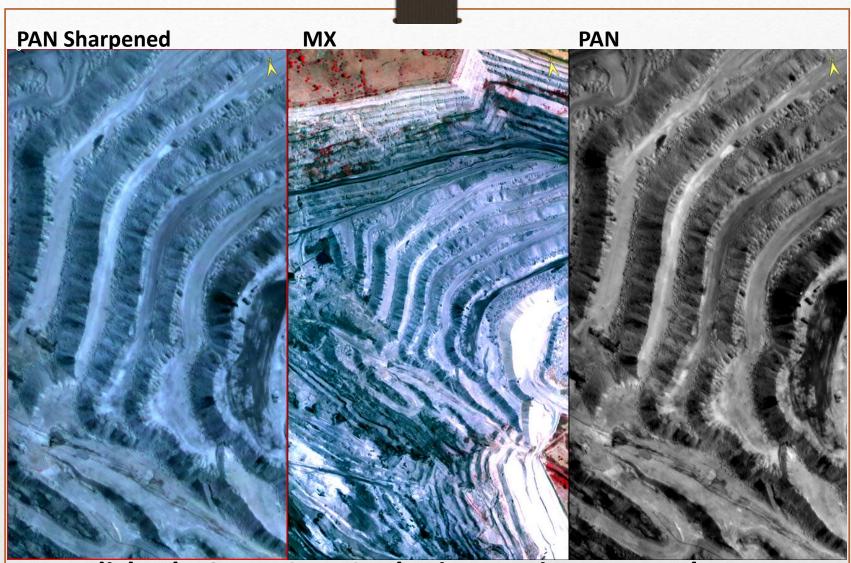

- Monitoring of Smaller AOI (~100 sqkm)
- Selected targets like monuments
- Object detection algorithms
- Asset information extraction, etc.

 Best efforts are put in realizing these new products for ease of handling and analysis -

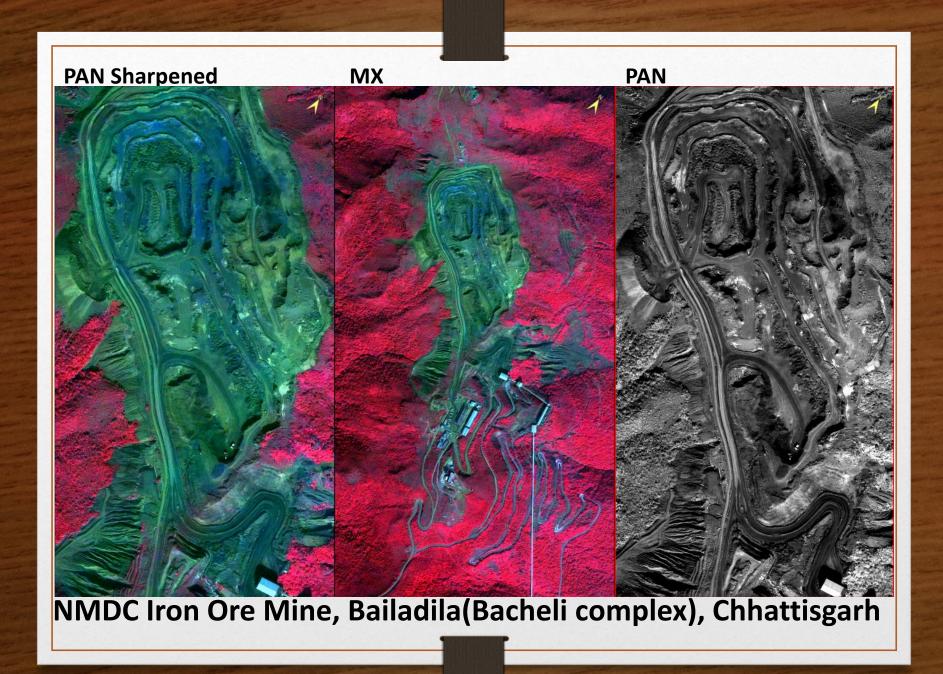

| Sensor | Processing Level | Output<br>Resolution | Swath<br>(km) |
|--------|------------------|----------------------|---------------|
| MX     | Geo Orthokits    | 1.1 m                | 10            |
|        | Orthorectified   |                      |               |
| PAN+MX | Pan Sharpened    | 45 cm                | 10            |
| PAN    | Geo Orthokits    | 45 cm                | 17            |
|        | Orthorectified   |                      |               |

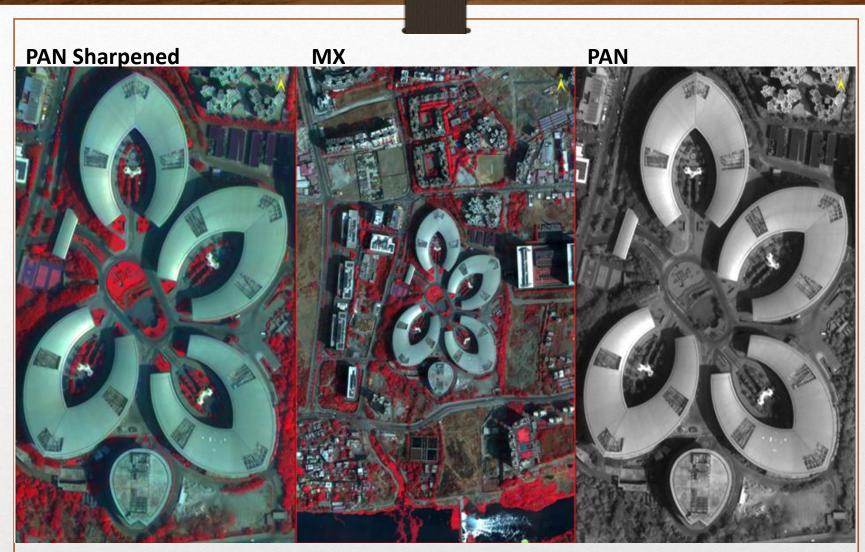

- MX 10km sub-swath is constituted from the near centre of the array & enables uniform radiometric quality across the swath
- New PAN Sharpened 45cm product enables improved sharpness & uniform radiometric quality across the swath

Data use case studies are –utility & infrastructure mapping; mining; precision agriculture, monitoring of sewage treatment plants, encroachments monitoring, river cleanup, etc.

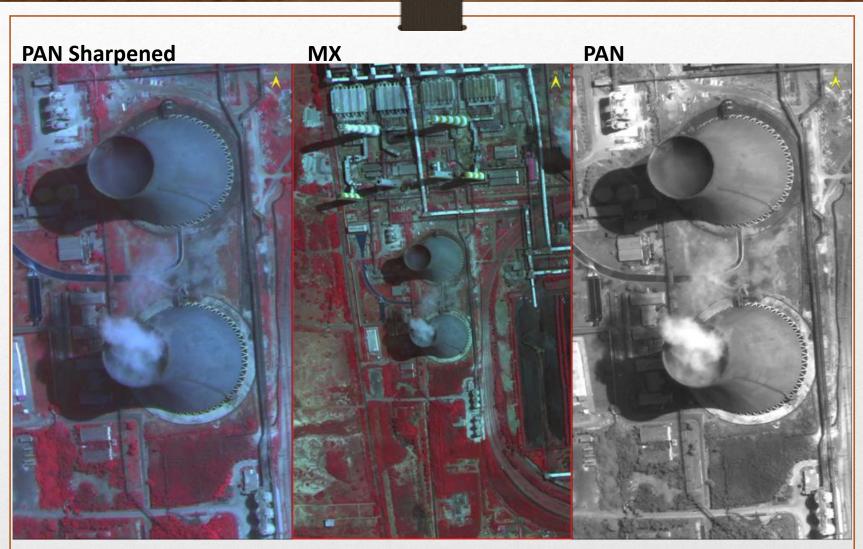

### Tadicherla Open Cast Coal Mine, Karimnagar, Telangana

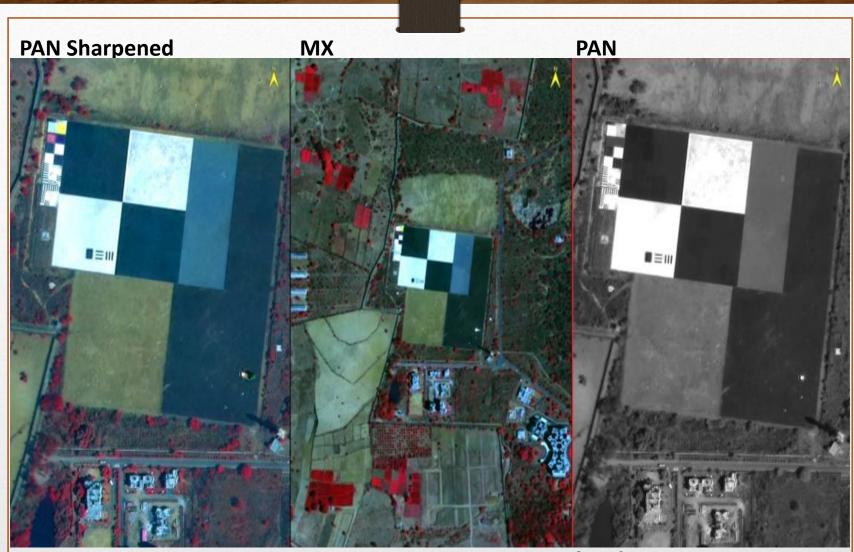

EON Special Economic Zone, Pune, Maharashtra

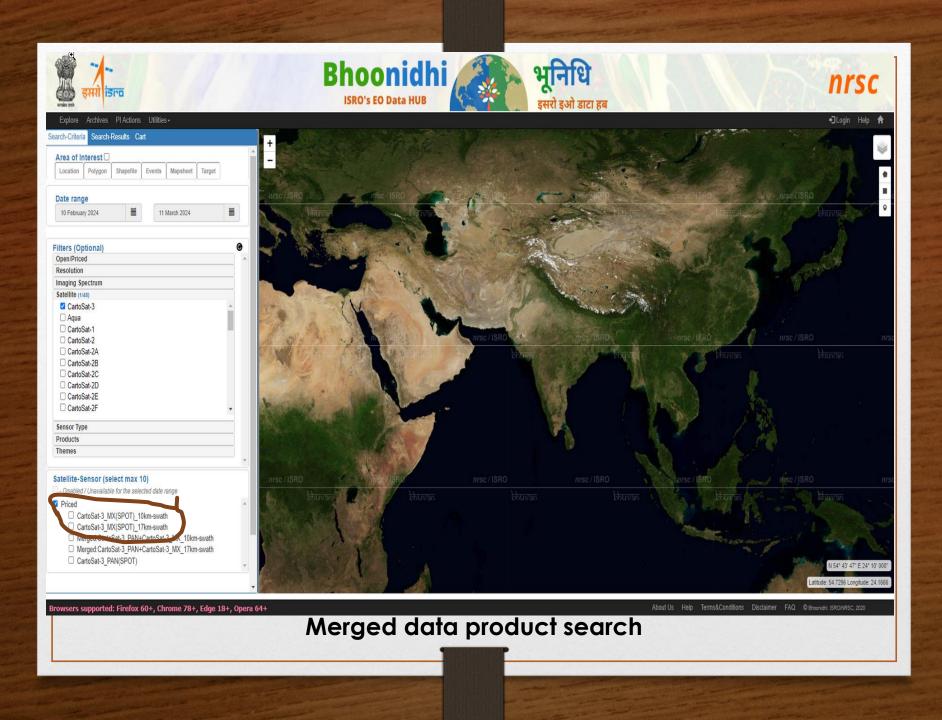

NTPC Thermal Plant, Visakhapatnam, Andhra Pradesh

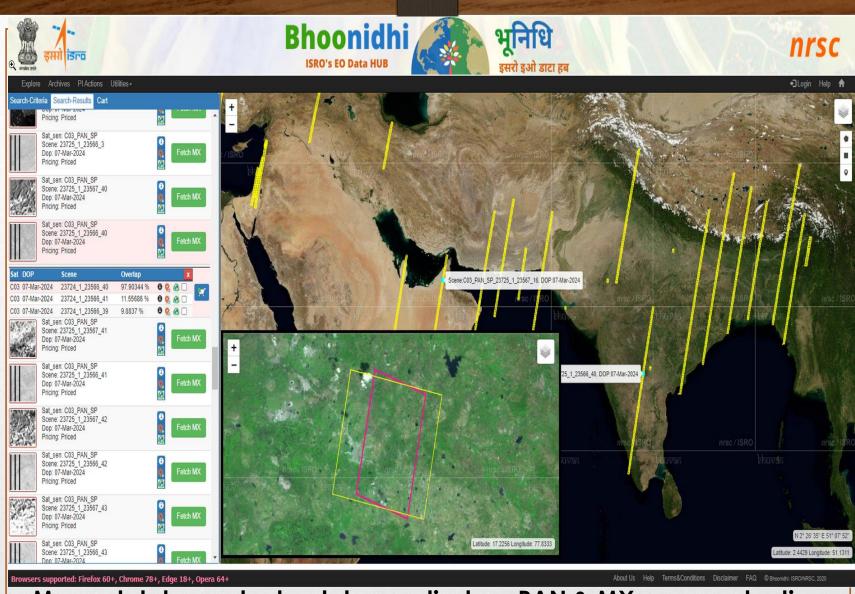

NRSC CAL-VAL Site, IMGEOS, Shadnagar
